

Lab 5

Creating Simple Bill by using Freehand MX tools.

Introduction:

Freehand MX is a vector-based drawing application software. It includes vector effects such as bend, stretch and transform. It combines a wide range of drawing tools with effect/special effects. Logo design is the combination of image and graphic in multimedia. And image can be in formats like JPEG, GIF etc. Graphics formats are specified to graphics primitive and their attributes. There are mainly two types of graphics.

- 1) Raster Graphic
- 2) Vector Graphic

1) Raster Graphic

Raster graphics (also called bitmap graphics) are digital images that are composed of a grid of pixels, where each pixel holds a specific color value. Raster graphics are resolution-independent, which means that if you scale them up, they become blurry or pixelated. They are ideal for complex images with fine color details such as photographs, painting or scanned documents.

Common Raster File Formats:

JPG, PNG, GIF, BMP

Raster Image:

A raster image is a specific type of image file that stores visual data in the form of a pixel matrix. Raster images are capable of displaying realistic color blending and shading, making them perfect for natural scenes or photographic content. Raster images don't scale well - zooming or enlarging can lead to loss of sharpness.

2) Vector Graphics:

Vector graphics are created using mathematical formulas that define shapes like lines, curves, circles, and polygons. These graphics are resolution independent, meaning they can be scaled to any size without losing quality. Ideal for print material, logos and forms like invoices or logos. Vector designs are composed of individual editable objects, making it easy to adjust parts without affecting the whole. Common file formats: AI, SVG, PDF, EPS.

Vector Image:

A vector image is made up of paths connected by points rather than individual pixels and is sharp because it's based on scalable geometry. These images are useful for precise design like technical drawings, diagrams and structured layouts.

Objectives:

- To create a simpler bill using Freehand MX.
- To understand the uses of different tools and shapes.

Materials:

Software used: Macromedia MX.

Procedure:

Step 1: Open the application and start a new project.

Step 2: Select the 'Rectangle Tool' and draw a rectangle to outline the bill.

Step 3: Use the 'Text Tool' to add details like company name, date, amount, contact, information etc.

Step 4: Format the text as needed using options like bold, italic, font size and style.

Step 5: Use the 'line Tool' or Rectangle Tool again to create a table layout on the bill.

Step 6: Label the table with headings such as serial no, item name, quantity and total cost.

Step 7: Once the bill is completed, save the file.

Shortcut keys:

- Ctrl + N: Create a new file
- Ctrl + Shift + D: Duplicate
- Alt + Shift: Resize shapes
- Ctrl + R: Show/hide ruler
- Ctrl + A: Align object

Tools used:

- Rectangle Tool: To draw rectangular shape
- Line Tool: To draw straight lines.
- Text Tool: To insert and write text on bill
