

Lab 4: Bouncing or moving ball in curve using macromedia director

Introduction:

Multimedia system integrate text, audio, image, animation and video to enhance communication. This lab focuses on the production phase (animation) and the preparation for distribution. Key techniques including tweening (generating intermediate frames) and interpolation (calculating motion) to create fluid animations.

Objectives:-

- To learn and apply animation techniques such as tweening, keyframing and interpolation to create smooth motion, specifically a bouncing ball animation.

Software / Tools used:-

- Macromedia Director 8.5

Steps for Bouncing ball Animation:-

- Open macromedia Director 8.5 and create a new cast member for the ball.
- Place the ball on the stage and define the starting keyframe.
- Define ending keyframes for the bouncing motion, allowing the software to interpolate the frames in between.
- Adjust the animation for the proper acceleration / deceleration.
- Play the movie from control.

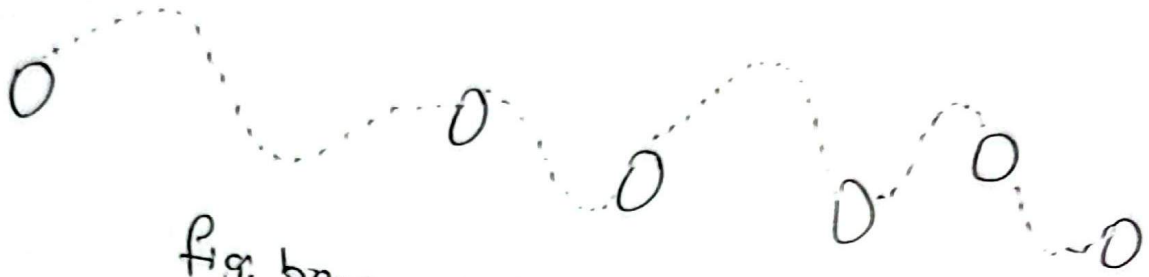

Fig. bouncing ball animation

Shortcut key:-

- Ctrl+Shift+N :- New cast member
- Ctrl+Alt+ :- Rewind to start
- Ctrl+G :- Open property inspector
- Arrow keys :- move play head one frame
- Alt+Drag :- Duplicate sprite in score
- Ctrl+Enter :- Play movie
- Ctrl+ . :- stop movie

Tools used:-

- Selection tool
- Rectangular tool
- Circle tool

Decision & Analysis:-

The bouncing ball animation worked currently and showed proper up and down movement. By changing the sprite position in each frame a smooth bouncing effect was created.

Conclusion:

This lab shows that using keyframes and interpolation in Macromedia Director 8.5 enable efficient creation of animation.
